EFFECTS OF UNHEALTHY FAST FOOD

- Major cause of heart disease, diabetes and some cancers. Worldwide, about 22 million children under age five are estimated to be obese or overweight.
- Face an increase risk of developing insulin resistance; risk factor for type 2 diabetes.
- High sodium intake (French Fries) is associated with higher blood pressure. High salt intake also increases the amount of calcium excreted in the urine.
- Food containing sugars and starches can promote tooth decay. These bacteria use sugars and starches to produce the acid that causes tooth decay.
